01 — THE PROBLEM

Delivery information lives everywhere except in one place.

After a customer signs on, project delivery information becomes scattered across chat messages, emails, calls, support conversations, internal discussions, and project tasks and updates.

FOR INTERNAL TEAMS

Teams manually collect and interpret updates before they can even understand the actual project state.

FOR CUSTOMERS

Customers have no simple unified view of progress, so they repeatedly contact teams for status updates.

THE CORE PROBLEM

Unstructured communication has to be manually converted into structured project status.

The Solution — Project IQ

Project IQ is an AI-powered project delivery intelligence platform that brings project information, issues, milestones, and unstructured updates into one unified system.

Monitor

Multiple projects from one dashboard.

Understand

Convert unstructured updates into structured status.

Ask

Use natural-language AI project queries.

Detect

Identify blockers, risks, and projects needing attention.

Share

Provide customer-safe project visibility.

CORE IDEA

Scattered Communication

AI

Structured Project Intelligence

One platform to monitor, understand, and act — instead of five disconnected habits.

From raw updates to structured intelligence.

Project IQ removes the need for teams to manually translate every message into project status.

The Intelligence Layer

The intelligence layer sits between raw communication and project operations, allowing teams to understand what is happening, why it is happening, and what should happen next.

Every stage of the flow — from raw message to customer-facing view — is generated automatically.

A connected feature set, not a scattered toolset.

1. Unified Project Dashboard

Total projects · Project owners · Customers · Current status · Progress · Milestones · Projects requiring attention

PRODUCT SCREENSHOT
Dashboard

2. AI Update Intelligence

Paste chat/email-style updates — AI converts them into structured project intelligence.

Status	Blocked
Risk	High
Action	Contact customer

3. AI Project Copilot

Ask natural-language questions:

"Which projects are at risk?"

"Which projects are behind schedule?"

"What should the team focus on today?"

"Give me a project status summary."

4. Issues & Delivery Tracking

Issue taxonomy used across projects:

- Bug
- Feature Request
- Question
- Support
- Implementation

5. Milestones & Tasks

Projects break into milestones and tasks with clear delivery states.

6. Activity & Update Intelligence

Every update strengthens the project's activity trail.

Watch an update turn into a decision.

BEFORE — UNSTRUCTURED UPDATE

"Backend is ready, but API testing cannot start because authentication credentials haven't been provided."

AFTER — STRUCTURED AI OUTPUT

Status	BLOCKED
Reason	Authentication credentials pending
Risk	HIGH
Required Action	Follow up with customer
Recommendation	Resolve dependency before testing

End-to-End Scenario

Example Query

Q: "Which projects need attention right now?"

A: "XYZ Logistics requires immediate attention because the project is currently blocked and progress is only 55%. The authentication dependency needs to be resolved before testing can continue."

Operational depth for teams. Clarity for customers.

Internal View	Customer View
Detailed project status	Project progress
Milestones	Milestone status
Tasks	Relevant updates
Issues	Customer-facing information
Project owners	Current status
Internal operational information	Controlled visibility

The internal team gets full operational visibility, while the customer gets transparent, controlled visibility.

PRODUCT SCREENSHOT

Internal View

PRODUCT SCREENSHOT

Customer View

System Architecture

Built simply. Designed to scale in intent.

Layer	Technology	Purpose
Application	Streamlit	Interactive web application
Language	Python	Application logic and AI workflows
AI	AI-powered analysis	Update intelligence and natural-language querying
Version Control	Git + GitHub	Source code management
Deployment	Streamlit Community Cloud	Public application deployment
Data	Synthetic / Mock Data	Prototype and demonstration

Before vs. After

Impact

Reduced Manual Effort

Faster Blocker Identification

Better Decision Making

Improved Customer Transparency

INNOVATION

The innovation is not simply displaying project data. Project IQ creates an intelligence layer between unstructured communication and project operations.

"What is happening?" · "Why is it happening?" · "What should happen next?"

From prototype to intelligence platform.

NOW — PROTOTYPE

- Project dashboard
- AI update analysis
- AI Copilot
- Issues
- Milestones
- Customer view
- Synthetic project data

NEXT — INTEGRATIONS

- Slack integration
- Email ingestion
- Meeting transcript analysis
- Project-management integrations
- Persistent database
- Role-based authentication

FUTURE — INTELLIGENCE

- Delay prediction
- Project health scoring
- Automatic escalation
- Automated customer notifications
- Advanced risk detection
- Project knowledge base

PROJECT IQ

AI-Powered Project Delivery Intelligence

Project IQ connects project information, issues, milestones, and unstructured communication into a single intelligence layer. It converts scattered updates into structured status and actionable insights while providing the right level of visibility to internal teams and customers.

**Project IQ doesn't just show project status.
It helps teams understand what is happening, why it is happening, and
what should happen next.**
